

ABSTRACT OF THE DISCLOSURE

A method of providing a program for a printed board packaging line is disclosed. A board packaging line coordinating computer downloads the service contract information and the application program contained in the contract information from an application server, and defines the board packaging line covered by the program and the device configuration of the line. The device configuration thus defined is uploaded to the application server, which, based on the device configuration thus uploaded, searches a prepared device driver group for a required device driver. This device driver is downloaded and set in each device by the board packaging line coordinating computer.
